# A polygon-based interpolation operator for super-resolution imaging

Stéfan J. van der Walt, B. M. Herbst

(Submitted on 12 Oct 2012 (v1), last revised 15 Oct 2012 (this version, v2))

We outline the super-resolution reconstruction problem posed as a maximization of probability. We then introduce an interpolation method based on polygonal pixel overlap, express it as a linear operator, and use it to improve reconstruction. Polygon interpolation outperforms the simpler bilinear interpolation operator and, unlike Gaussian modeling of pixels, requires no parameter estimation. A free software implementation that reproduces the results shown is provided.

## Radiometric Dating

Extract, count, and orientate mineral fission tracks.

Research by **Alexandre Fioravante de Siqueira**. Images courtesy of Raymond Jonckheere (TU Bergakademie Freiberg, Germany) and Sandro Guedes de Oliveira (Unicamp, Brazil).

## Material sciences

The tomographically scanned object is a drilled cylinder of a metallic alloy with two phases (an aluminium-copper alloy). The goal is to label and visualize pixels of the light phase.

Research by **Emmanuelle Guillard**.  
Experimental data acquired by Pierre Lhuissier, Luc Salvo and Elodie Boller on the ID19 tomography beamline of the ESRF synchrotron.
